Tips from this project

When you want to change or edit a section, it is best to open the Navigator and use it, which will make your work more efficient.

If there are many text files such as pdf or png that need to be displayed, if they are combined into volumes and stored in the media library, their links can be referenced directly in the page, so that there is no need to create separate web pages for them.

If you want to extract colors from some images, you can use this website https://imagecolorpicker.com.

You can usually look at famous websites such as Amazon, eBay, Times... to improve your layout level and use inspect to view their website architecture.

When editing a page, do not open multiple editors to edit the page, as this may clutter the page.

On the editing page, do not turn on responsive mode, which will cause WordPress to only edit the web page on this device's screen.
